

Project: How's the Weather

Name: Shubham Mudgal

Mobile Application Development - Android Project

Creative Brief:

Description:

We all want to know how's the weather is before going out anywhere. Some of us like to surf on a sunny day while some like to know whether there'll be wind before going for kite flying. 'How's the Weather' app will allow users to know if it's going to rain, or if it's too cold and not taking that sweater while going for a walk is probably not the best idea.

Inspiration:

The in-built Weather app is one of the most used apps that I have on my phone. The idea here is to replicate the app (and probably make it better in future) and allow easy user interface.

Goal:

To built an app which takes in any location by city name or zip code, and returns the weather of that particular location to the user. The app would call an api with the provided location details and fetch results. The results will be manipulated and shown to the user in a user-friendly manner.

Intended Audience:

The app is aimed to be used by anyone who wants to know the weather outside before getting ready and wearing shoes. Users may range from a 3 years old to 93 years old(or more). And people of all gender and background who own an android phone may use this app.

Prelim Design:
