Project: AV Player (Media Player)
Name: Shubham Mudgal
Mobile Application Development

Creative Brief:

Description:
MediaPlayer is an app which supports playing of audio and video files on an android smartphone. Any audio/video on the phone will be displayed in a folder view in the app and can be clicked to play. The user will have the option to choose any player of his/her choice or the inbuilt android player.

Inspiration:
It is found that cell phones these days are used more to view a video or listen to a song than it is used to actually make a call. I want to develop an easy interface for the user to view videos and listen to songs of his/her choice.

Goal:
To use android in-built player to play audio/video files. The files will automatically be read and shown in a folder-like easy view on the app and can be played by the user.

Intended Audience:
The app is aimed to be used by anyone and everyone with an android phone and who has an interest in playing songs or videos. Any age group from 5-85 should be able to understand and use the app.

Prelim Design:
